

CONFIDENTIAL: NOT FOR DISTRIBUTION

Panoramic Survey Cross-tabs Results

June 2017

Erick Lachapelle, PhD

Principal Investigator, EcoAnalytics | Associate Professor, Université de Montréal

Panoramic Survey Cross-tabs Results

Introduction

This report presents the cross-tabulation results of the EcoAnalytics Panoramic Survey, which was conducted in May 2017.

Each table corresponds to a question asked. Note that several questions are not included in these tables. You will also see that Table 31 has been excluded, as its content will be presented later. In the interests of simplicity, we exclude a number of the split-sample (A/B) experiments, the environmental value and socialization batteries, and several non-substantive socio-demographic questions, which in most cases require a different form of presentation and analysis. These experiments, environmental values, socialization and socio-demographic questions will be extensively featured in our written reports and webinars.

With the exception of the questions asked in the regional modules, all tables included here summarize responses for the total sample, as well for key demographic sub-groups. When reading these tables, you might wish to look first at the top row, titled “Total.” Here you can then see the distribution of responses at the aggregate (totals) level by running your eye across this row.

Rows beneath the top line show the distribution of responses for particular socio-demographic sub-categories. In addition, we break out the data by survey mode, comparing responses obtained from telephone and web samples. We ran additional tests to highlight where significant differences are found:

- The percentages highlighted in **blue** indicate significantly lower levels for a particular sub-group relative to all other population sub-groups, at a 95% level of confidence.
- The percentages highlighted in **red** indicate significantly higher levels for a particular sub-group relative to all other population sub-groups, at a 95% level of confidence.

Essentially, these tests allow us to answer the question: *When we cut the data by a particular socio-demographic, do significant differences across sub-groups emerge?*

The numbers contained in the tables reflect *weighted percentages*: that is, the frequencies are weighted to better represent actual population characteristics. The column titled “Sample size” indicates the *actual number* of respondents in each category. This is the unweighted frequency, or sample size of each sub-group in the sample.

To maximize the number of questions included in our survey, and to facilitate respondent recall, we employed the same 0–10 scale in a number of questions. While this numeric scale will facilitate analyses to be featured in the analytical reports, we had to re-scale these questions for the purpose of presenting them in a cross-tab. We recoded answers to these questions as follows: 0–1 = strongly disagree/oppose/distrust; 2–4 = somewhat disagree/oppose/distrust; 5 = neutral; 6–8 = somewhat agree/support/trust; and, 9–10 = strongly agree/support/trust.

Another advantage of this numeric scale, as indicated in the tables where it was used, is the ability to compare means and standard errors. Advanced readers may find this useful, as it provides a more precise indication of “average” opinion for each sub-group on each question.

Method

The data in the survey have been gathered using rigorous methods to ensure they are of the highest quality. This includes a mixed-mode hybrid design combining probabilistic random digit dialling (RDD) telephone samples with non-probabilistic samples drawn from one of the largest commercial internet panels in Canada. We will share details about response rates and samples in future analyses.

TABLE 1

Compared to ten years ago, do you think the health of Canada's environment has improved, worsened or stayed about the same?

		Sample size	Improved	Worsened	Stayed about the same	Not sure	Refused

TABLE 20

In assessing environmental problems and associated solutions, different groups of people claim to have relevant expertise.

On a scale from 0 to 10, where 0 means no trust at all and 10 means a great deal of trust, how much do you trust each of the following on matters pertaining to environmental problems and solutions?

Environmental groups

		Sample size	Strongly not trust	Somewhat not trust	Neutral	Somewhat trust	Strongly trust	Not sure	Refused

TABLE 26

On a scale from 0 to 10, where 0 means strongly disagree and 10 means strongly agree, how strongly do you agree or disagree with each of the following statements related to environmental issues in Canada?

Environmental charities play a crucial role in policy and should have the right to push government for stricter environmental laws.

		Sample size	Strongly disagree	Somewhat disagree	Neutral	Somewhat agree	Strongly agree	Not sure	Refused

TABLE 38

Currently about 90% of Canada's terrestrial land and freshwater are not set aside to protect wildlife and ecosystems.

Do you think governments should do a lot more, somewhat more, a lot less, somewhat less, or about the same as now to protect terrestrial land and freshwater areas in Canada?

		Sample size	A lot more	Somewhat more	About the same as now	Somewhat less	A lot less	Not sure	Refused
	Total	1502	57%	25%	11%	3%	1%	3%	0%
